# TEAM INTRODUCTION

**Title:** Smart Vision for Quality Assurance in Ecommerce

**Team Name:** harshmeena7879

**Team Members:**

**Harsh Meena** (Deep Learning, Generative AI) , **Harsh Singh** (Natural Language Processing, Convolutional neural network training, Computational Resources Management) , **Priyanshu Dwibedi** (Frontend Developer Streamlit) , **Abhijit Mukharjee** (Natural Language Processing, Convolutional neural network training, Computational Resources Management) , **Lucky Jaiswal** (Computer Vision)

**College/University:** IIIT bhubaneswar , SIRT bhopal

**Date:** 20<sup>th</sup> October 2024

# EXECUTIVE SUMMARY

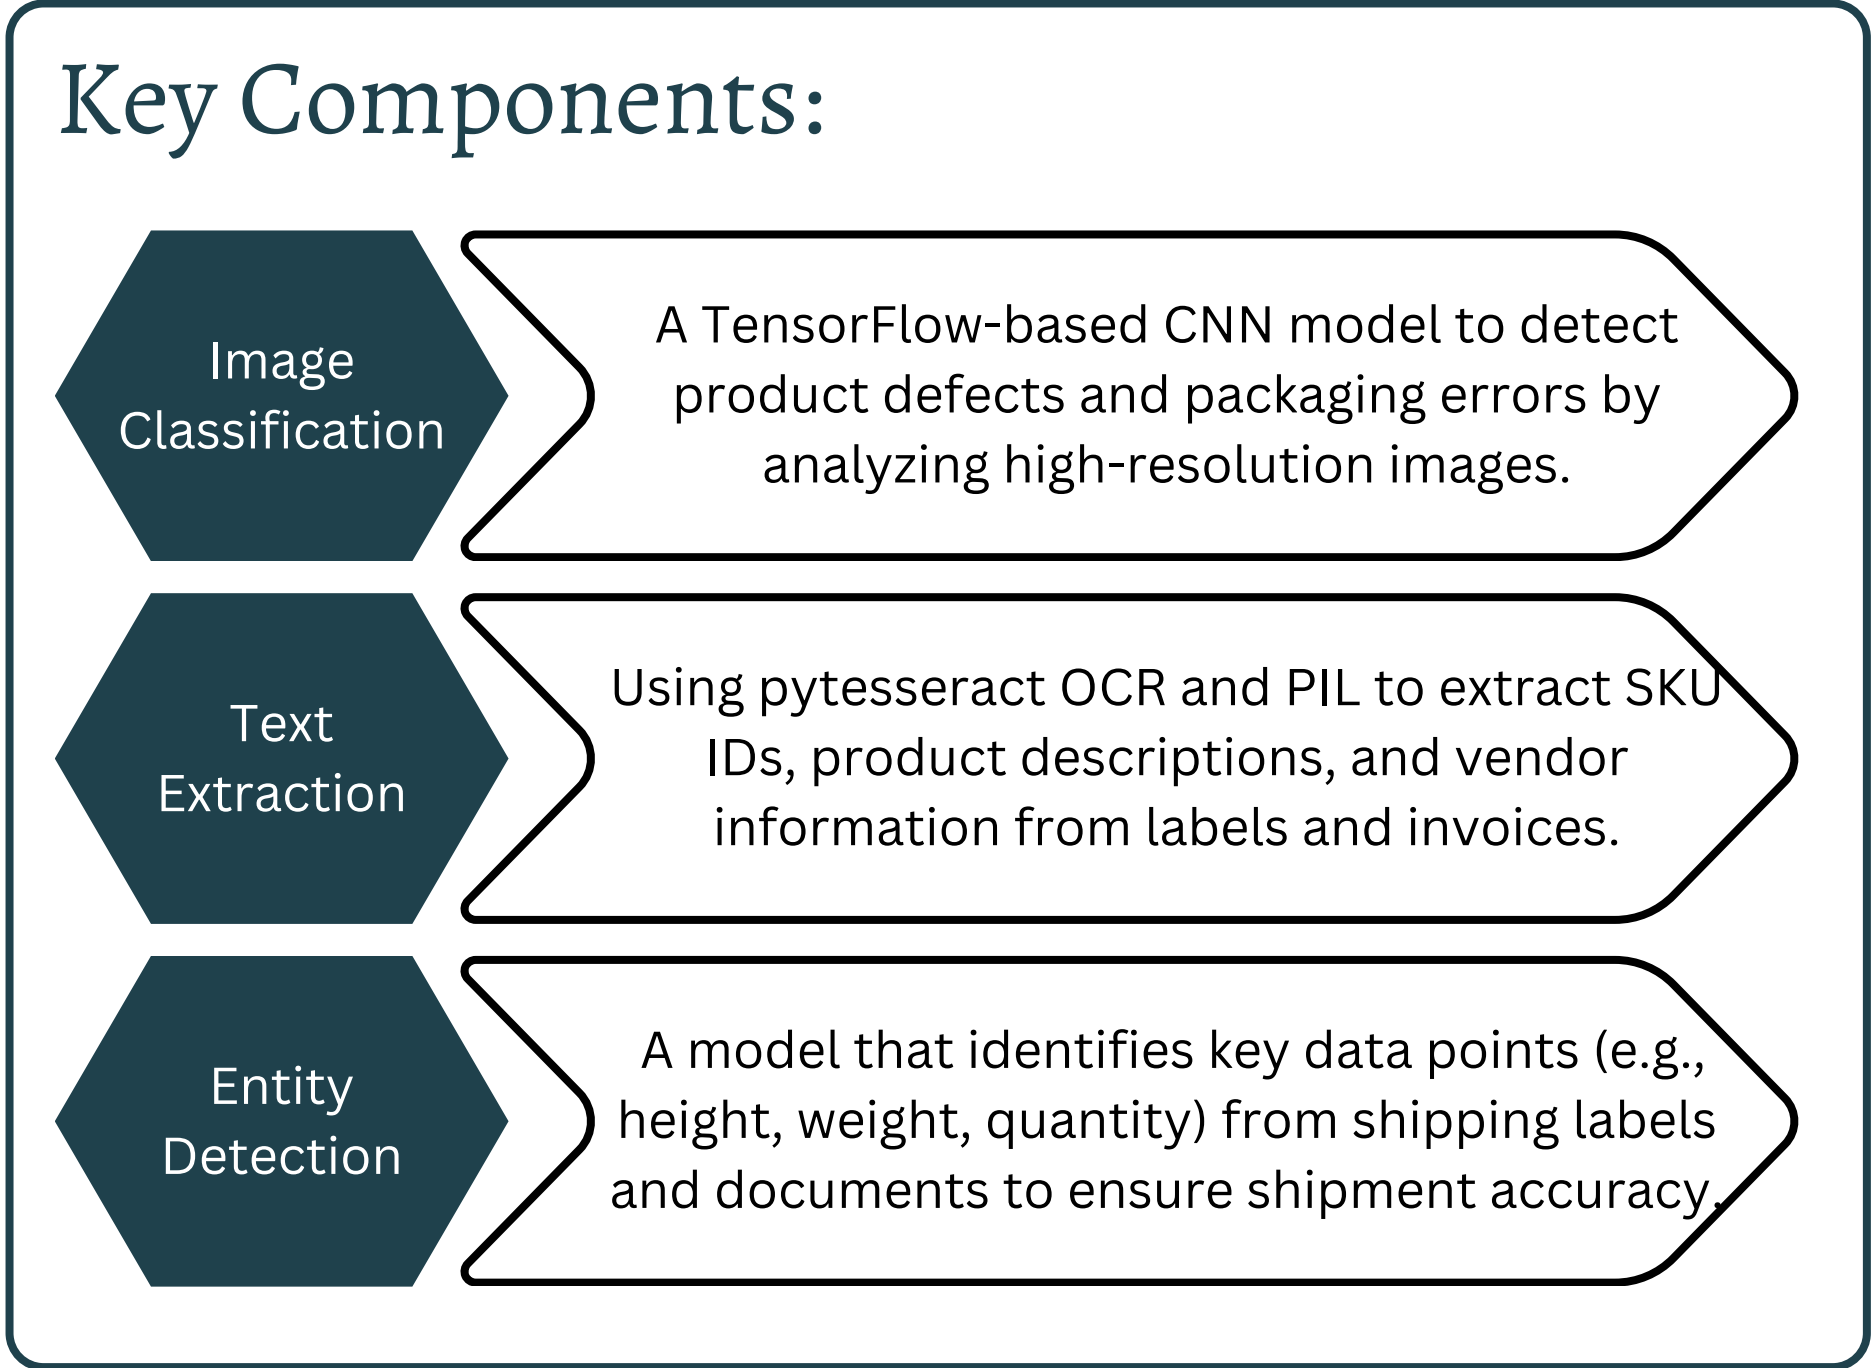

Our solution addresses the challenge of automating the quality and quantity assessment of ecommerce shipments using advanced camera vision technology. By integrating machine learning and image processing, we provide a fast, accurate, and scalable system for real-time product inspection.

## Problem:

Automating the quality and quantity assessment of ecommerce shipments using smart vision technology.

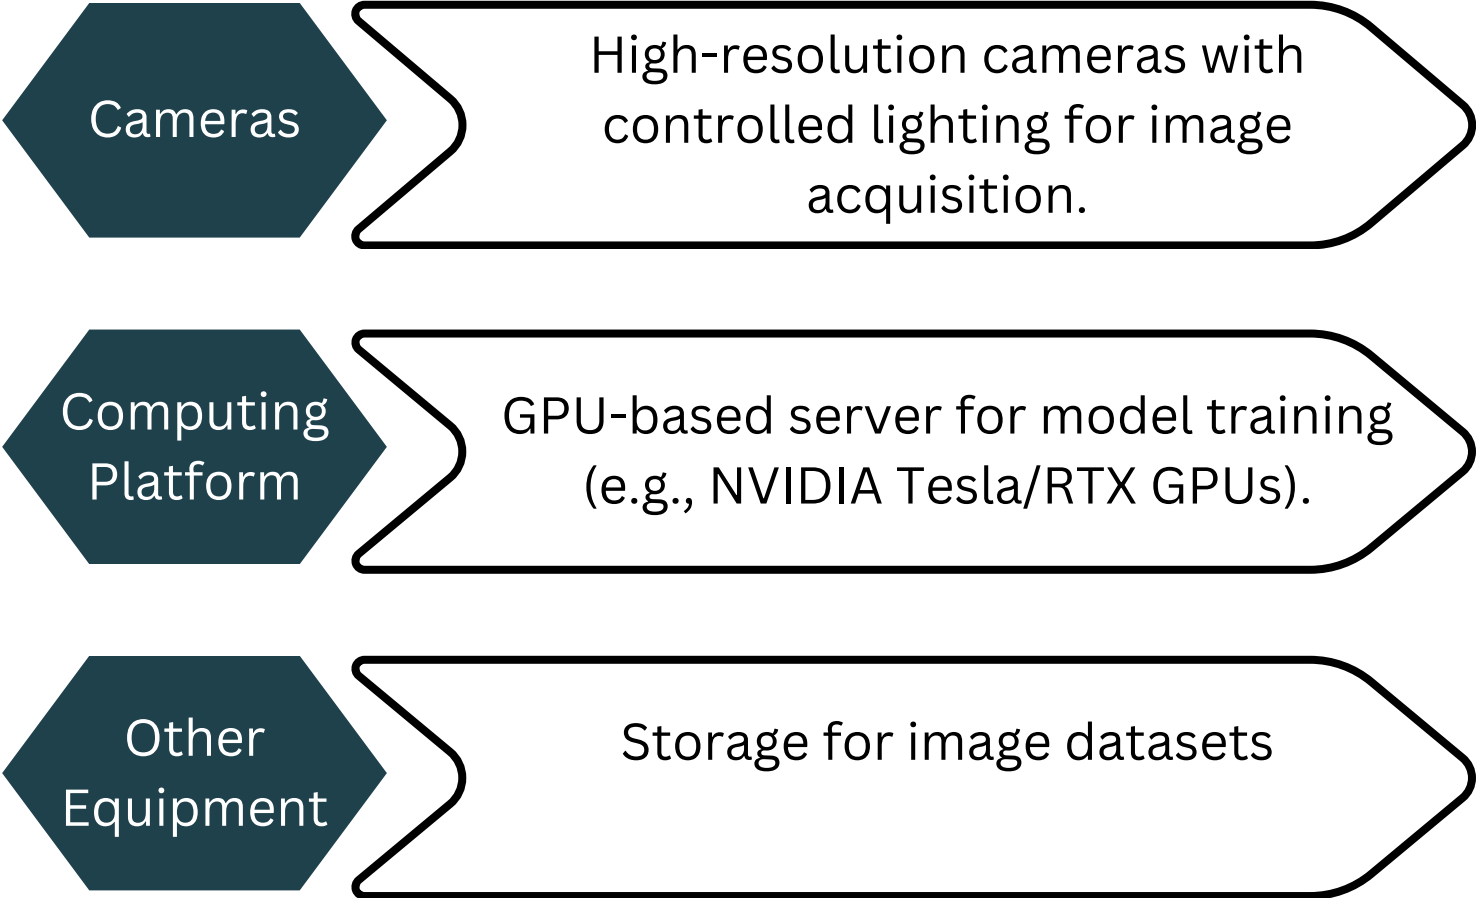

## Objective:

To develop a system that utilizes camera vision and machine learning to detect product defects and validate shipment accuracy in real-time.

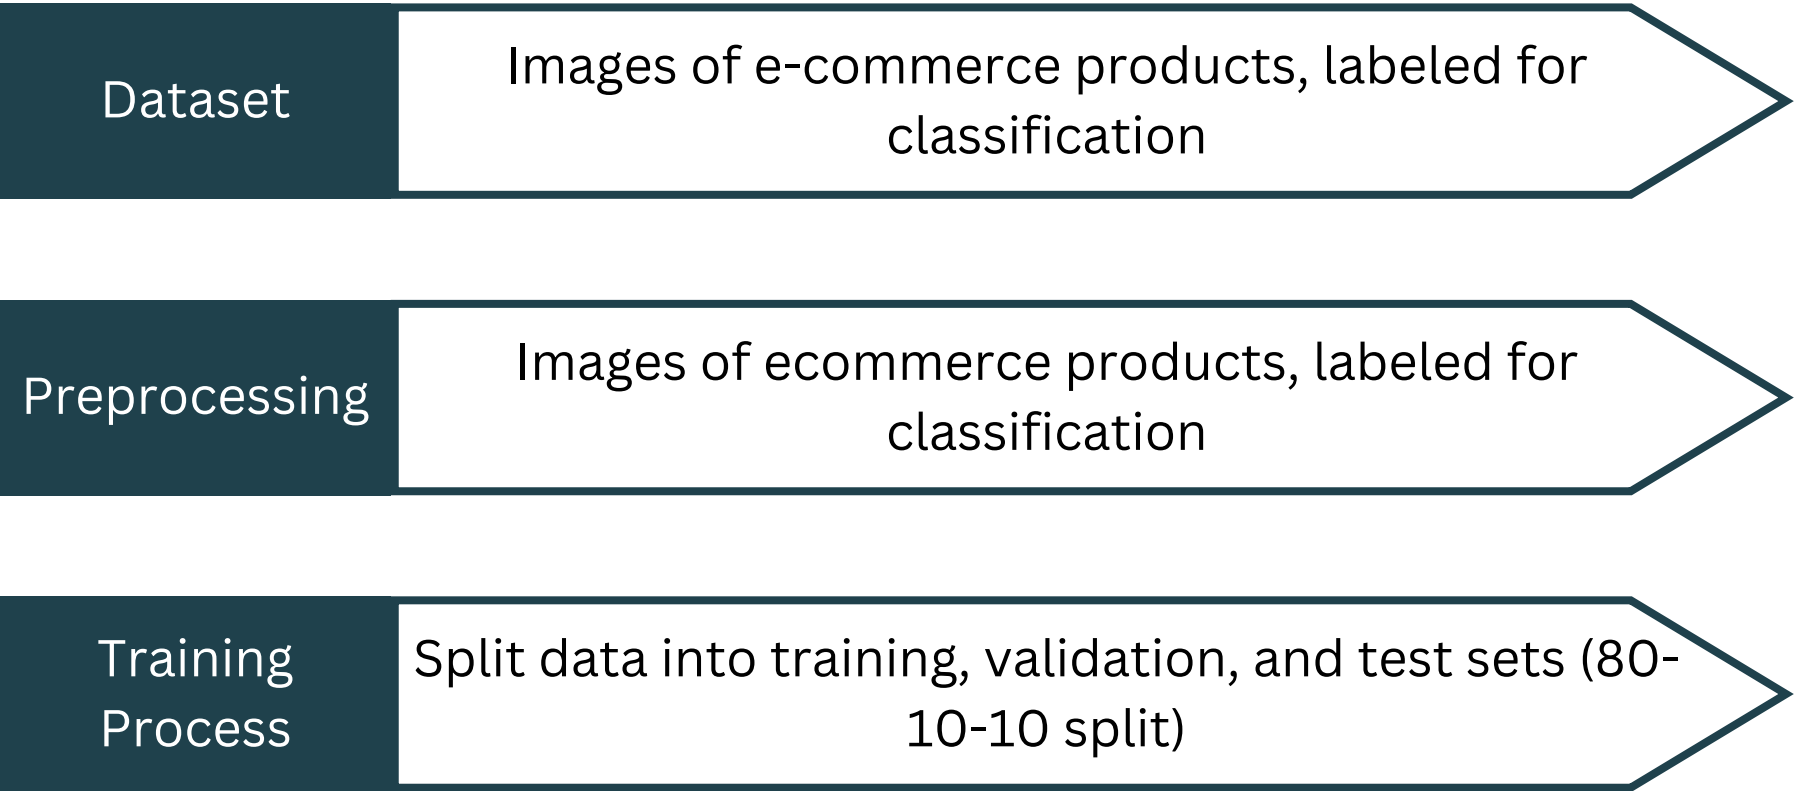

# TECHNICAL APPROACH

## Hardware Specifications:

## Data and Model Training:

## Tech stack:

# Code snippets:

```
model = Sequential([
    Conv2D(32, (3, 3), activation='relu', input_shape=(150, 150, 3)),
    MaxPooling2D(2, 2),
    # Additional layers...
    Dense(1, activation='sigmoid')
])
model.compile(optimizer='adam', loss='binary_crossentropy', metrics=['accuracy'])
```

Image Classification (CNN): Key code for building the convolutional neural network in TensorFlow.

```
import re
```

```
text = "Product Height: 20cm, Weight: 500g"
height = re.search(r'Height: (\d+)', text).group(1)
weight = re.search(r'Weight: (\d+)', text).group(1)
print(f"Height: {height}, Weight: {weight}")
```

Text Extraction (OCR): Code using pytesseract for extracting text from product labels.

```
import pytesseract
from PIL import Image

img = Image.open('sample_image.png')
text = pytesseract.image_to_string(img)
print(text)
```

Freshness analysis

```
# load VGG16 model + higher level Layers
base_model = VGG16(weights = 'imagenet', include_top=False, input_shape=(150, 150, 3))
#Freeze the base model
base_model.trainable = False

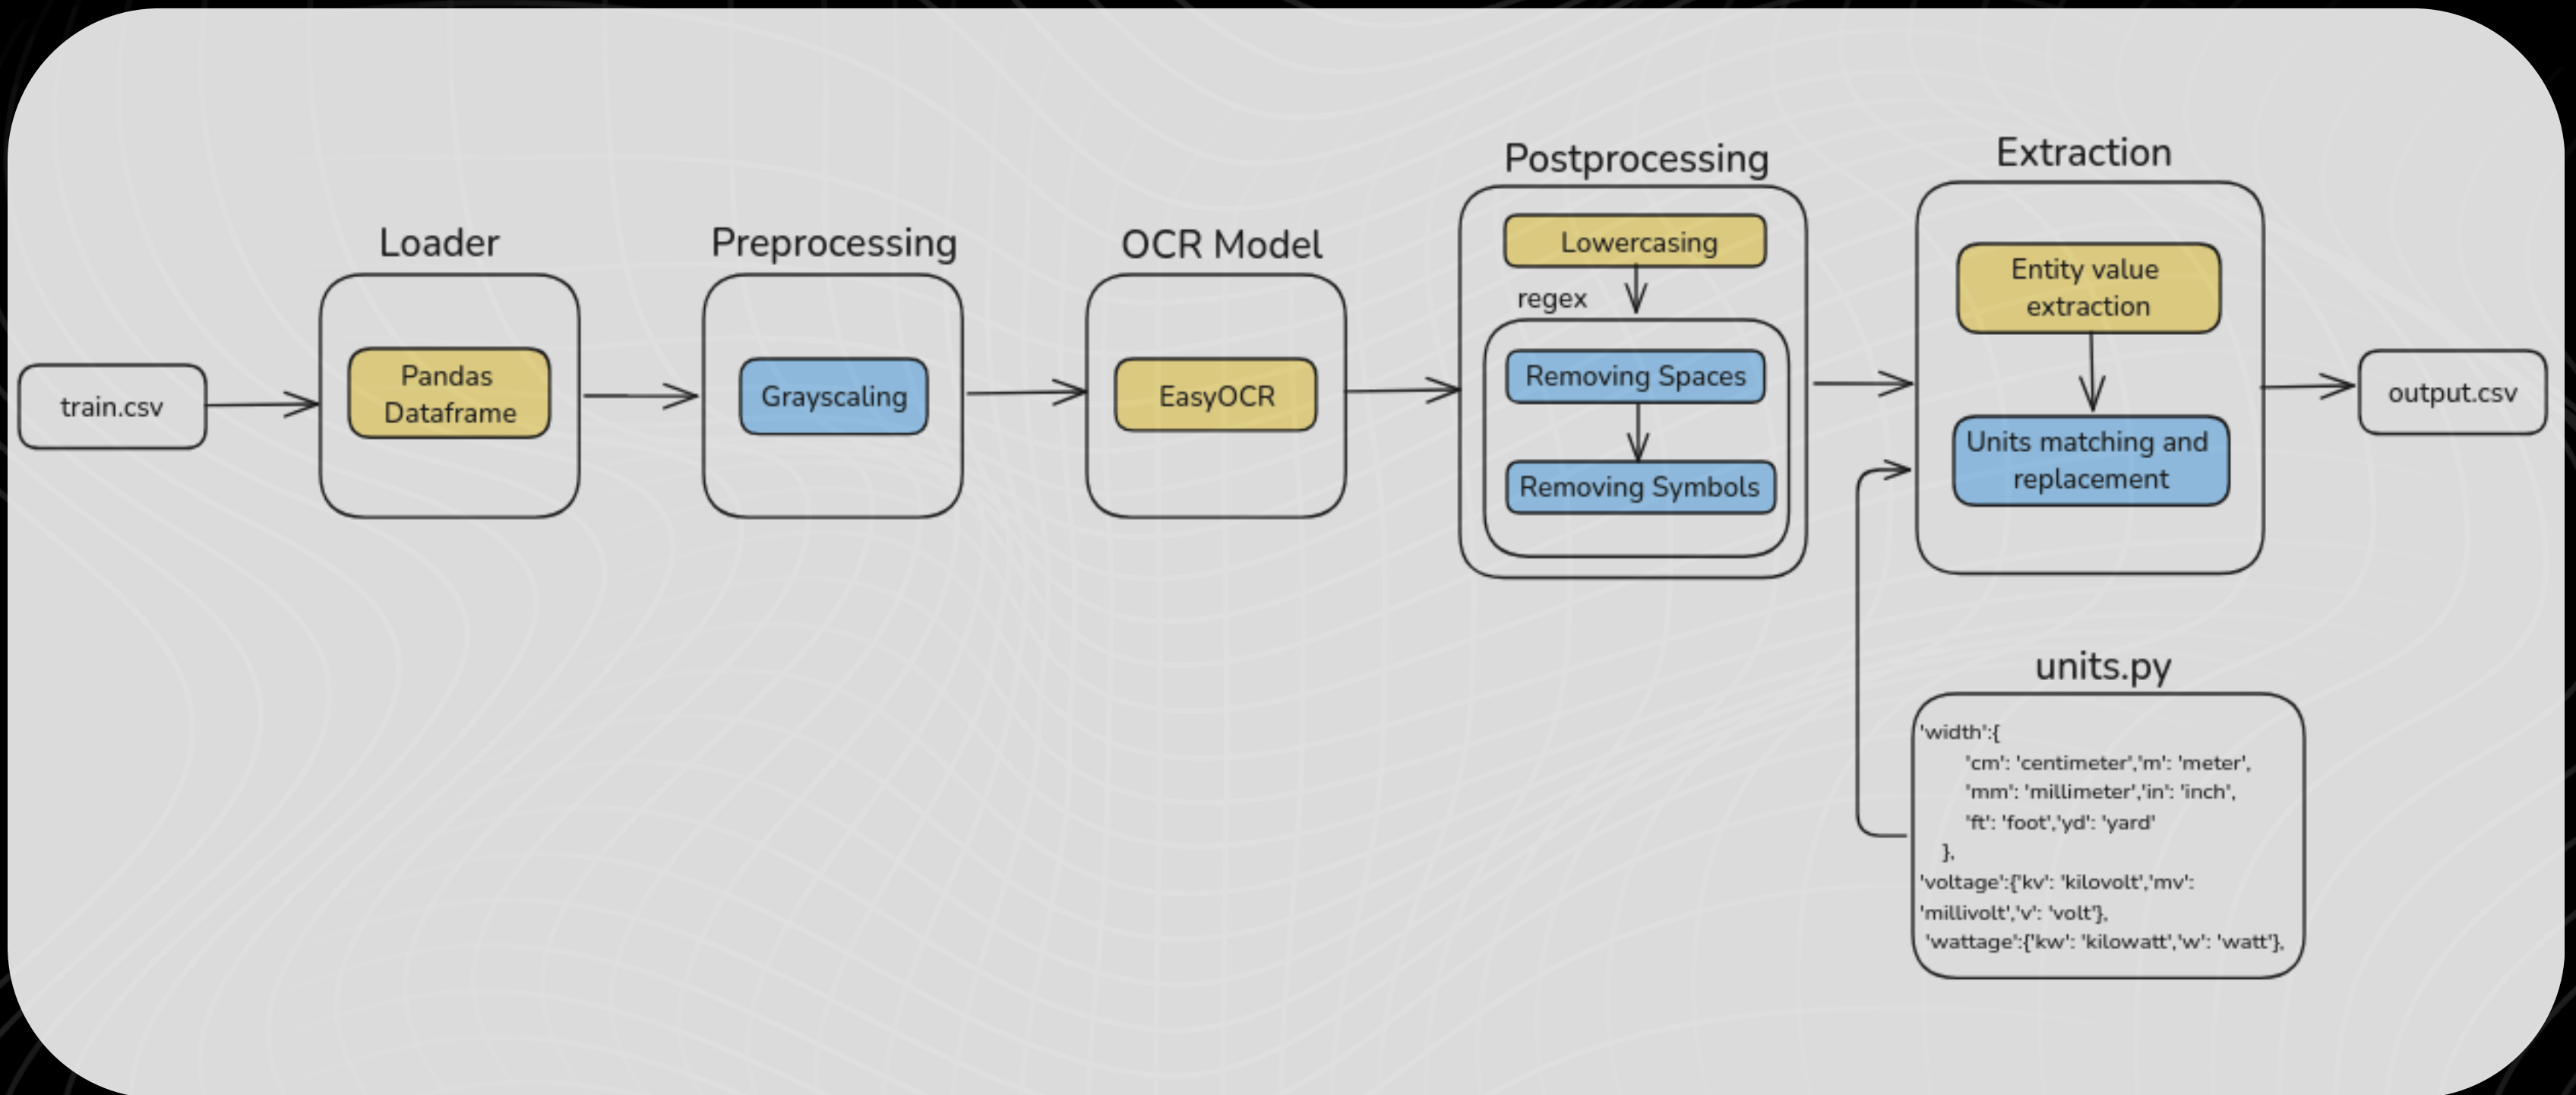

#Create the hybrid model

model = Sequential(
    base_model,
    Flatten(),
    Dense(256, activation = 'relu'),
    Dropout(0.5),
    Dense(len(train_generator.class_indices), activation = 'softmax') #Output layer
)
```

Entity Detection (Height/Weight): Example NLP code to detect numeric entities.

# WORKING FLOWCHART

# EXPECTED OUTCOMES

## 1. **Accuracy:**

- The smart vision system should achieve a high level of accuracy in detecting defects, misclassifications, and packaging errors in ecommerce shipments.
- Target: At least 95% accuracy in identifying defective or incorrect items.

## 2. **Efficiency:**

- The solution must streamline the quality control process, significantly reducing the time taken for inspections compared to manual checks.
- Outcome: Increase inspection throughput by up to 50%, allowing for quicker order fulfillment without compromising quality.

## 3. **Cost-Effectiveness:**

- The implementation of this solution should lead to lower operational costs by minimizing manual labor, reducing error-induced losses, and ensuring faster processing times.
- Outcome: Decrease the need for manual inspections and reduce product returns due to inaccurate shipments.

## 4. **User Experience Improvements:**

- By ensuring high-quality and correctly packaged products, the system will enhance customer satisfaction and reduce returns, leading to better reviews and repeat business for ecommerce companies.
- Outcome: Improved customer experience through reduced shipping errors and faster deliveries.

# KEYPOINTS:

- Real-world applicability, expected benefits for ecommerce businesses, reduction in operational inefficiencies.
- Robustness of algorithms, scalability of the system, ease of implementation within existing logistics and warehouse workflows.
- Originality of approach, novelty in applying smart vision systems for ecommerce quality control.
